

Elleeplex Re-Gen (Next Gen) New formulation now allows for alternative application options as it is a cream emulsion that has been designed to give more optimum mixing capabilities.

## APPLICATION OPTION 1: MIX METHOD

*Mix with setting lotion for Lash Lift / Lamination and Brow Lamination*

*After performing lifting or laminating steps:*

- Dispense setting lotion into dish, then dispense one (1) very small drop of Re-Gen to the mixture at ratio of 8 parts Setting Lotion and 1 part Re-Gen and combine.

**Warning: Mixing too much Re-Gen could dilute the performance of the setting lotion, so only mix a very small amount of Re-Gen into the mixture if you choose this method.**

- Allow setting lotion to process for the usual timing you would use for the relevant hair texture (generally 5 - 8 mins depending on hair strength and texture).
- Remove combined lotions in the usual manner for lash lift and brow lamination procedures.
- If proceeding to tint after your treatment do not combine Re-Gen with tint.

**Special note: If you are performing a tinting / colouring service after lash lift or brow lamination mix Re-Gen with the tinting step only.**

**Special note: DO NOT leave Re-Gen on the brows after brow lamination as a leave on conditioner. Instead only use Elleeplex Aftercare serum if brows require more hydration.**

## OR APPLICATION OPTION 2: STAND-ALONE METHOD

*Stand-alone nourishing treatment after setting lotion step with lash lift (only)*

*After performing lifting or laminating steps:*

- Carefully remove the setting lotion from the lashes with a damp cue tip, but leave lashes still attached to shield or rod.
- Dispense a small portion of Re-Gen into a dish or glue ring and apply the Elleeplex Re-Gen to the entire lashes. Apply 1mm above the base lash line area all the way up the lashes to the tip. Avoid product touching on the skin or eye line area. Apply using an application brush, micro brush or lip brush. Allow to absorb for 3 - 5 mins and proceed to removing and rinsing all product, glue and shields / rods from the lashes.
- Brush through and dry the lashes with a mascara brush.

## OR APPLICATION OPTION 3: EXPRESS TINTING METHOD

- Dispense tinting colour into dish and mix with oxidant / developer.
- Once tint is mixed with developer proceed to dispense and mix 1 small drop of Elleeplex Re-Gen (Next Gen) into the tinting mixture. (Maximum ratio of 8 parts tint to 1 part Re-Gen).
- Proceed to tinting eyelashes or brows in the usual manner.
- Warning: Mixing too much Re-Gen could dilute the performance of the tinting colour, only mix a very small amount of Re-Gen into the mixture if you choose this method.

**Elleeplex Aftercare** and **Elleevate** retail products can be applied after all services to help style and give extra hydration. For more information on using Elleebana products contact your closest distributor or [www.elleebana.com](http://www.elleebana.com)
